Annual Snapdragons

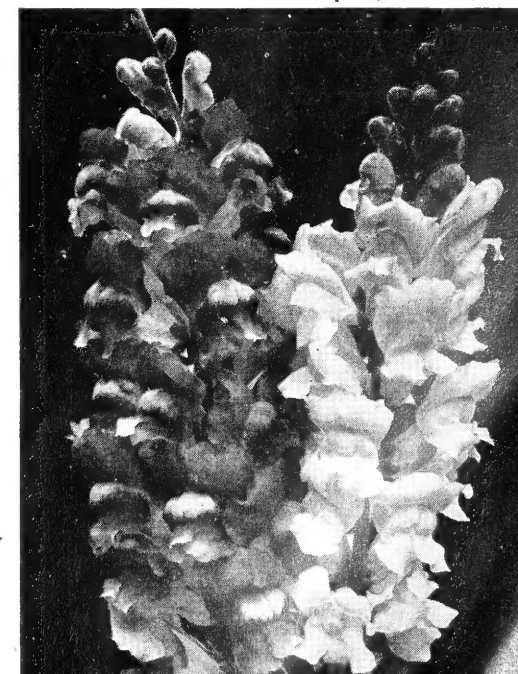

## Tips On Snapdragon Culture

Antirrhinum (Snapdragon) seed should be started in flats early in the spring. Care should be taken not to plant the seed too deeply, or to over-water. When plants are large enough to handle, they can be pricked off into 2½-inch pots and hardened in the cold frame for later transplanting.

Seeds may also be sown directly in the open soil and then thinned out, leaving seedlings about a foot apart.

Snapdragons are a hardy annual and excellent results may be obtained by fall sowing.

# Max Schling's Annual

It is our wish that we would have sufficient space to list all of the testimonials that we have received in praise of this marvelous seed value. Carefully blended to strike a perfect balance between the showy bright annuals and those of more subdued tendencies, the result provides a bold effect where required and a vista of real beauty covering large areas where it would be impossible to intensely cultivate a garden. # Max Schling's Magnificent PETUNIAS

Only lately have Petunias been recognized as splendid cut flowers. They are so prolific that proper culture requires frequent trimming of the plants so that cutting the blooms not only provides a splendid source of cut flowers, but aids the general growth of the plant as well. Petunias are impartial. They will grow anywhere, in semi-shade or in hot, dry sunny locations. ## Cultural Hints for Sweet Peas

Sweet Peas require cool weather for satisfactory results. For this reason, very early sowing is to be recommended. A rich, well drained soil is preferred, and full sun is necessary. Fall planting produces good results.

The Cuthbertson strain of Sweet Peas is resistant to heat, and is, therefore, recommended in hot locations where other varieties may be disappointing.

# SEEDS of HARDY FLOWERS

## PERENNIALS AND BIENNIALS

**HOW TO GROW THEM.** Hardy plants (perennials) bloom the second year from seed and are permanent thereafter. Some of them may bloom the first year if the seed is sown very early. Among the perennials we find some of the most beautiful flowers for cutting and many of the old-fashioned sorts dear to our childhood memories. A hardy border properly planned and planted is a source of joy from early spring to late autumn; during that period it will be resplendent with color and yield an abundance of bloom for indoor decoration. The plants need little attention other than to be kept free from weeds and given an occasional top-dressing of plant-food.

**WHEN TO SOW.** Seed may be sown in hotbed in February or March, or out-of-doors from the first days of May to mid-August. It is well to sow as early as possible, thus permitting the plants to become strong and well established before winter.

**WHERE TO SOW.** For most perennials a cold frame is an ideal place for starting seeds, but if you do not have one, make a seed-bed of finely sifted light soil, adding and mixing thoroughly well-decayed manure, humus, or prepared plant-food. Sow the seeds in shallow drills, covering  $\frac{1}{8}$  inch or more, according to the size of the seed, but very fine seed should only be lightly pressed into the soil.

**CARE OF SEEDS AFTER SOWING.** Press down the bed with a flat board, and water gently but thoroughly with a fine spray. Do not permit the soil to become dry while the seed is in process of germination, for until the plant develops roots its life depends entirely on moisture. Nearly all failures in growing perennials may be attributed to drying in the seed-bed, which should be carefully watched and watered until the plants have made four to five leaves.

**CARE OF PLANTS AFTER GERMINATION.** Most seeds will germinate in from eight to fourteen days, but others may need a month or so; therefore do not become impatient. If seedlings come up very thickly, pull out some and transplant to boxes or other seed-beds; later they may be set out in the permanent place. Transplanting should be done before October 1st, to permit the plants to become established before frost. Mulching the plants with leaves, salt hay, or peat moss about the middle of December is a distinct advantage. The leaves and hay must be removed in spring, but the peat moss may remain. Full cultural directions will be found on each packet of Schling's seeds.

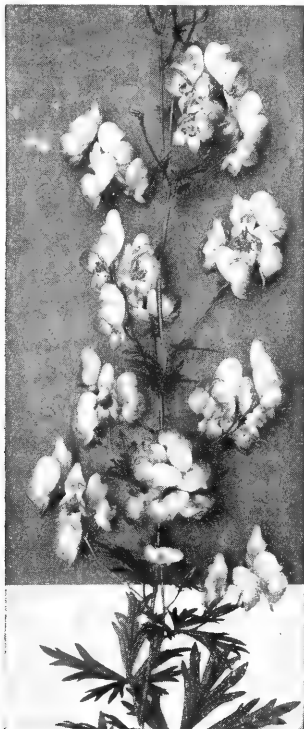

Everybody wants perennials in generous measure, to secure effects in color and charm. If you delay and finally buy plants, an attractive perennial border may require several hundred dollars' worth of plants.

Exactly the same results can be secured with \$10 to \$15 worth of seeds! And aside from the money-saving, you have the fascination of growing your own plants, nursing them from the beginning, and loving them all the more. Sow your seeds now, and the plants will bloom next year.

## The Why of Home-Grown Vegetables

Home grown vegetables came into their own during the War when Victory Gardening was the patriotic and common-sense thing to do.

Many succulent items such as Sweet Corn, Watermelons and Cucumbers were proscribed because of the space required to grow them, and it was for that reason we introduced our famous "MIDGET VEGETABLES": **Mason's Golden Midget Corn, Midget Watermelon, and Tiny Tim Tomato.** The novelty of these vegetables actually captured prize publicity spots in national magazines and in the press in general.

Those who contemplate abandoning vegetables should realize that store bought garden produce can never equal the succulence of the home grown kind. Lettuce is one item that should be grown at home as well as the famous Midgets. For that reason we have added the **Famous Bibb** and new **Bronze Beauty Lettuce** to make a perfect collection of vegetables to be grown by the small home gardener.

"Don't Let Your Victory Garden Be-  
come a Memory."

## The Why of Home-Grown Vegetables

Home grown vegetables came into their own during the War when Victory Gardening was the patriotic and common-sense thing to do.

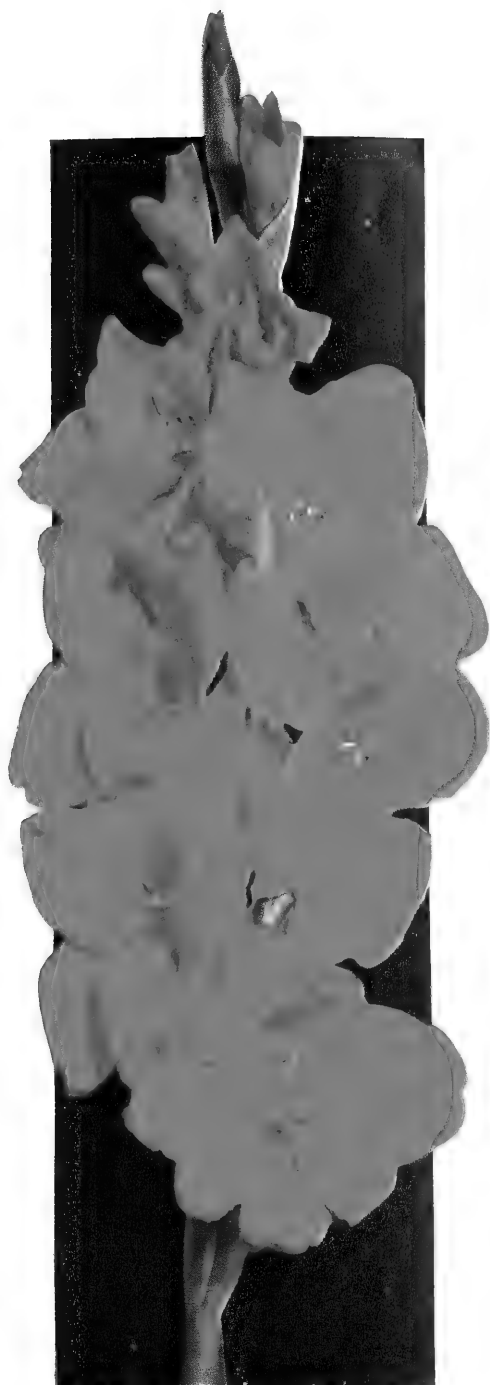

Many succulent items such as Sweet Corn, Watermelons and Cucumbers were proscribed because of the space required to grow them, and it was for that reason we introduced our famous "MIDGET VEGETABLES": **Mason's Golden Midget Cern, Midget Watermelon, and Tiny Tim Tomato.** The novelty of these vegetables actually captured prize publicity spots in national magazines and in the press in general.

Those who contemplate abandoning vegetables should realize that store bought garden produce can never equal the succulence of the home grown kind. Lettuce is one item that should be grown at home as well as the famous Midgets. For that reason we have added the **Famous Bibb** and new **Bronze Beauty Lettuce** to make a perfect collection of vegetables to be grown by the small home gardener.

## NOTES ON GLADIOLUS CULTURE

Gladiolus bulbs can be planted in the latitude of New York from April 15th to July 10th. If successive flowering is desired, we recommend planting two weeks apart.

Gladiolus do best in rich soil with a sunny location. They will not tolerate shade. Any type of rich soil is satisfactory, but it is well to use a general purpose fertilizer before planting, and to apply at least one side dressing when the plants are 12 to 15 inches high.

For exhibition spikes it is necessary to provide water during the entire growing season, and in periods of drought water should be applied at least once a week, soaking the ground to a depth of about four to five inches.

When cutting Gladiolus spikes, do not cut all the foliage from the plant. Allow the two outside leaves to remain to provide substance for next year's bulbs.

It is our sincere advice to you not to attempt to grow Gladiolus unless you are prepared to spray regularly throughout the growing season to control Gladiolus thrips. Any good commercial dust or spray containing at least 10% DDT can be used with good effect. Spraying should be done every week or ten days after the leaves are six inches tall.

If this program is followed your Gladioli will be the most rewarding of all your garden flowers, and will repay you well for your time and care.

Hardy Water Lilies can be set any time from May 1st until the end of August, but tender Lilies not before June. Order early.

A simple way to plant Water Lilies is on rich soil in boxes 2 feet square and 1 foot deep. Cow manure is the best fertilizer, but commercial fertilizers can be used. Place one Water Lily root in each box, cover the crown of the plant, then cover with one inch of sand or gravel, to prevent discoloration of the water, and sink the boxes in the pond. # A Proven Success! A SUCCESSION OF SWEET CORN

This marvelous collection has met with spontaneous approval. The results obtained since its introduction are a source of great satisfaction. Many years ago we introduced our famous Long Season Pea Collection. Now, we take pleasure in presenting our Long Season Hybrid Sweet Corn Collection. As a result of experiments conducted by the Connecticut Experiment Station, which is the leading authority on Hybrid Sweet Corn in the United States, we are able to offer a collection of five varieties of Hybrid Sweet Corn which will bear in constant succession for a period exceeding four weeks with no two varieties ripening together. In order to continue the season after the collection has ripened we advise successive plantings of Golden Cross Bantam which is the latest variety in the collection and which can be planted with safety up until July 1st, or the two additional varieties listed below.

Each one of these varieties has been chosen for its wilt-resistant qualities, heavy-bearing propensities and fine flavor. For this reason we can offer this collection with absolute assurance in the fact that these varieties can be classified as wilt-resistant—heavy bearing—excellent flavor.

Spancross 4.13. Extra early.

Marcross 13.6. Early.

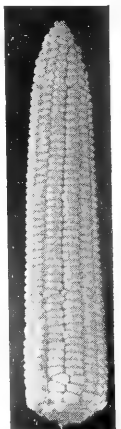

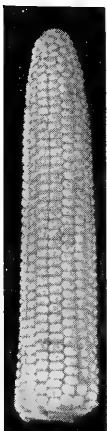

Carmelcross 39.13. Early midseason.

Whipcross (Lincoln) 39.23. Midseason.

Golden Cross Bantam. Late midseason.

## Method of Handling

At the time when you usually sow your early Sweet Corn, arrange to plant the entire collection together. Every two weeks thereafter plant an additional quantity of Golden Cross Bantam until the latest possible date.

## Beans—Bush, Snap

**Culture:** Beans grow well in any good garden soil. Usually the first planting can be made the last week in April, followed by successive plantings about 2 weeks apart until August 15. Open a drill 2 inches deep and drop the Beans 1 inch apart and cover. When well up, draw the soil up against the plants and cultivate frequently. Do not cultivate them when the dew is on the plants as this frequently causes rust. **One pound of seed is sufficient for 50 feet of drill.**

**Bountiful.** Stringless; surpasses all others in crisp, tender qualities and fine flavor.

**Tendergreen.** Round, dark green, stringless and tender.

**Plentiful.** Strong productive plants, light green straight flat pods, entirely stringless and of excellent flavor.

## Lima Beans—Bush

Bush Limas are nearly 2 weeks earlier than Pole Limas. The seed is quite tender, and will rot while the ground is cold or wet, so do not plant before the ground is warm. For best results, however, the seed can be started in pots in a hotbed or in the greenhouse, and the plants set out when the weather is settled. Plant in rows 3 feet apart and from 4 to 6 inches apart in the row, all ways edgewise, with the eye down.

**Baby Potato.** Most outstanding Bush Lima to date. Exquisite flavor and prolific production. Matures in 72 days.

## Beans—Pole Limas

Where poles can be secured, these Beans are more productive than the Bush varieties. Set poles 3 feet apart, enrich the soil in the hills by mixing with a liberal supply of fertilizer or well-rotted manure. Do not plant until the ground is warm. One pound will plant 50 poles.

# Max Schling's Luscious Peas

## New Pea, Early Dwarf Giant-Podded

The name in itself is descriptive as is the illustration. We have found this variety to be one of the best producers and finest home garden Peas, and we feature it at no advance in price over regular varieties. Pkt., 20c; 1/2 lb., 35c; lb., 60c; 2 lbs., \$1.15.

**IMPORTANT.** All varieties in this Collection must be planted at one time as early in the spring as the ground can be worked.

Our famous ever-bearing collection has undergone a complete revision this year. Tests have proven to us that varieties of recent development have superior qualities over some of our old favorites. With the exception of the last two varieties in this collection, (which could not be replaced), we offer a new revised garden Pea collection.

You may even prolong the season for another week or two by making a second planting of No. 6 (Heroine) about 2 to 3 weeks later, but not after May 10.

## DO YOU KNOW THIS SECRET?

Do you know how to avoid the usual disappointment of a poor Pea crop after mid-July? It is easy to get big crops of luscious juicy Peas "falling right over one another," in steady succession even up to late August—if you learn this secret:

Instead of planting at 2- to 3-week intervals, get the following picked varieties and plant all at once in early spring, the moment the ground can be worked. This will allow a good root-system to develop before hot weather comes. The varieties will bear in the order shown below (and pictured opposite), beginning about June 20 and keeping up a steady succession of big mouth-watering crops until late August.

**Petit Pois.** A delicate French Pea of very sweet flavor. Preferred by those who appreciate the finest things on the menu. Pkt., 35c; 1/2 lb., 75c; lb., \$1.35.

## Edible-Podded or Sugar Peas

Eat the pods with the Peas. The pods are fleshy, tender, juicy, very sweet, stringless, and are cooked and served like String Beans.

**MAMMOTH MELTING SUGAR.** Height, 4 1/2 feet.

**DWARF GREY SUGAR.** Height 20 inches.

## PRICES OF PEAS

All varieties: Pkt., 25c; 1/2 lb., 50c; lb., 90c; 2 lbs., \$1.70, (except Petit Pois).

## LEGUME-AID—Inoculant

All Legumes are aided in their growth if treated with an inoculant that increases their ability to obtain nitrogen from the air. Full directions for proper use will be found on each package. Splendid for garden Peas, all Beans, Sweet Peas and Lupins. Packet sufficient to treat 5 lbs. of seed, 10c.

## TRAIN-ETTS

## WILD WHITE CLOVER

A comparatively recent introduction of this strain of Clover. It is very vigorous and of a thick, dwarf growth. An important feature is its lack of flowers which is a great advantage in maintaining a green lawn. Wild White Clover is more vigorous than any weed, and because of its all around excellence we recommend its use in the finest lawns, whereas in the past we have never recommended the use of ordinary Dutch White Clover except for specific purposes. One pound is sufficient for 800 square feet. Price: 1 lb., \$3.00; 5 lbs., \$14.00.

## JAPIDEMIC

### MILKY DISEASE SPORE POWDER

U. S. Department of Agriculture Formula  
Made Under Government License  
and Supervision

U. S. Department of Agriculture has finally found the specific control of Japanese Beetles, the Milky Spore Disease which remains ever present and active for all time on the ground. In fact, its effectiveness spreads by means of bird droppings, wind, etc.

Experiments proved that in less than two years the beetle population of the most highly infested areas has dropped almost 60% and in three years have become almost non-existent. The parasitic disease attacks the larvae in the ground and need only come in contact with the larvae to cause infection.

## Non-Poisonous, Perfectly Safe to Use

Full instructions for many methods of application appear on each package. It is easiest to apply by mixing proper amounts with fertilizer and distributing it at the same time. The material never spoils. It can be kept for years and, remember, once your ground is inoculated, it remains inoculated forever.

For guaranteed beetle protection, use it yourself, induce your neighbors to use it, and influence your local civic organization to use it.

Price: \$5.15 per lb., postpaid anywhere in U. S. A.

No discount for quantity.  
One pound sufficient for 4000 square feet.
